

Which of these is a “designated initializer”?

(hint: Car class has three public properties: make, model, and color)

- a. `+(instancetype)carWithMake:(NSString *)make;`
- b. `-(instancetype)initWithMake:(NSString *)make;`
- c. `-(instancetype)init;`
- d. `-(instancetype)initWithMake:(NSString *)make model:  
(NSString *)model andColor:(NSString *)color;`

What prints to the console?

```
BOOL success = YES;  
NSLog(@"Operation was %@", (success) ?  
@"successful" : @"not successful");
```

Operation was successful

How could this be refactored to be more efficient?

```
if (fuelLevel >= 0.2)
{
    if (numberOfWheels == 4)
    {
        // Make the car drive
    }
}
```

```
if (fuelLevel >= 0.2 && numberOfWheels == 4)
{
    // Make the car drive
}
```
