

What method is called to move focus to a textfield and bring up the system keyboard?

```
UITextField *aTextField;  
[aTextField ...];
```

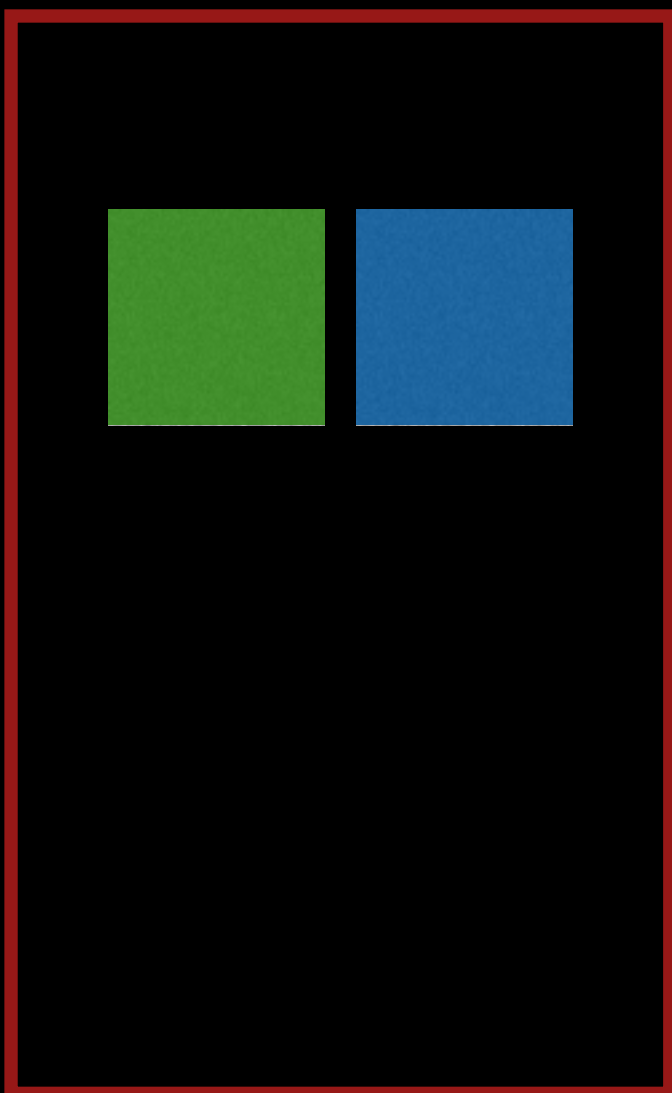

```
[aTextField becomeFirstResponder];
```

Finish the conditional so it checks that the string is at least 6 characters.

```
if ( [aString ... ] ... )  
{  
    // aString is at least 6 characters  
}
```

if ([aString length] >= 6)

What auto layout rules could you use to ensure these two subviews (as a group) are centered horizontally onscreen and have a constant horizontal margin from each other?

Create a view in between them

- * same height
- * 0 width
- * centered horizontally with superview
- * vertical space to top layout guide

Anchor each colored view off this invisible one

- * horizontal space to invisible view
- * center y with invisible view
- * equal heights
- * some width
