

What two methods must be implemented on a model class to enable it for use with NSCoder?

- `(void)encodeWithCoder:(NSCoder *)aCoder;`
- `(id)initWithCoder:(NSCoder *)aDecoder;`

The value of the city object's name property in the original view controller will be updated (true or false).

```
self.city.name = @"Winter Park";  
UIViewController *aViewController;  
aViewController.city = self.city;
```

```
(Inside a method of aViewController)  
self.city.name = @"Orlando";
```

true

What will print to the console?

```
typedef enum {  
    DataFetchTypeCoordinates,  
    DataFetchTypeWeather  
} DataFetchType;  
  
DataFetchType type = DataFetchTypeWeather;  
NSLog(@"Current fetch type: %d", type);
```

Current fetch type: 1
